Feedora

AI-Powered Real-Time Surplus Food Donation Network

Team Byteess

Anandi Mahajan – Lead Developer & AI Systems | Tanmay Tripathi – Product Strategy & Integration

PROBLEM STATEMENT

1

The Scale of Waste

Restaurants, hotels, and stores discard tons of perfectly edible surplus food daily — simply because there is no fast way to redirect it.

2

The Coordination Gap

NGOs and shelters need consistent food supply, but have no real-time visibility into what surplus exists nearby, or when.

3

Time-Sensitive Logistics

Surplus food has a short safe window. Manual calls, emails, and ad-hoc pickups are too slow — good food expires before it reaches anyone.

4

No Shared System

Donors, NGOs, and volunteers operate in silos with no shared platform to match supply with need in real time.

EXISTING SOLUTION AND GAPS

Existing Solutions

- Manual phone/WhatsApp coordination between restaurants and NGOs
- Generic classifieds or social media posts for surplus food
- City-specific food banks with fixed pickup schedules

Gaps That Remain

- No real-time matching — by the time a call connects, food may already be wasted
- No way to discover the nearest available NGO automatically
- No tracking of pickup, delivery, or actual impact
- No incentive system for donors to participate consistently

PROPOSED SOLUTION

Feedora is a real-time platform that connects surplus food donors directly with nearby NGOs and volunteers — like a delivery app, but for donations.

Post Surplus in Seconds

Donors post quantity, food type, and expiry window with one tap

Smart Auto-Matching

AI-based scoring matches surplus to the best-fit NGO by distance, urgency, and need

One-Tap Claim & Pickup

NGOs claim instantly; volunteers are auto-assigned for delivery

Live Impact Dashboard

Real-time tracking of meals saved, CO2 avoided, and people fed

UNIQUE SELLING PROPOSITION (USP)

01 Real-Time, Not Manual

Live posting and matching replaces slow calls and messages — food moves before it spoils

02 AI-Powered Matching Engine

Live scoring model ranks NGOs by distance, urgency, and reliability — automatically routing every post the moment it's created, no manual matching, no dispatcher

03 End-to-End Visibility

From posting to pickup to delivery, every step is tracked — for the first time donors see their real impact

04 Built for Everyone

SMS fallback for NGOs without smartphones ensures no organization is left out

SYSTEM ARCHITECTURE

Flow Overview

- 1 **Donor App** → Post surplus food (type, quantity, expiry, location)
- 2 **Matching Engine** → AI scores nearby NGOs by distance, urgency & reliability
- 3 **NGO App** → Receives live notification, claims food in one tap
- 4 **Volunteer Layer** → Auto-assigned for pickup & delivery with route optimization
- 5 **Impact Dashboard** → Updates meals saved, CO2 avoided & donation receipts in real time

Core Components: Mobile/Web App | Firebase (Auth, Firestore, Functions) | Google Maps API | AI Matching & NLP Layer | Push/SMS Notifications

TECH STACK

Frontend

React.js (Web) + Tailwind CSS

Backend / Database

Firebase — Firestore, Authentication, Cloud Functions

Maps & Geolocation

Google Maps API for live location & distance matching

AI / Matching Layer

Custom scoring algorithm + Claude/GPT API for auto-categorizing food posts

Notifications

Firebase Cloud Messaging (push) + Twilio (SMS fallback for NGOs)

Hosting & Deployment

Vercel (frontend) + Firebase Functions (backend)

IMPACT & BENEFITS

1000+

Meals saved per month per city, at scale

40%

Reduction in coordination time vs manual outreach

0

NGOs left out — SMS fallback ensures full inclusion

Broader Benefits

- Reduces landfill waste and methane emissions from rotting food
- Gives donors verifiable impact & tax-deduction receipts
- Builds a reliable, transparent supply chain for NGOs
- Strengthens community trust between businesses and local shelters

FUTURE SCOPE

Computer Vision for Food Logging

Auto-detect food type & quantity from photos — zero manual entry for donors

Predictive Demand Forecasting

Predict when/where surplus typically occurs so NGOs can pre-plan pickups

Spoilage Prediction Model

ML-based safe-consumption window estimation using food type & ambient conditions

Multi-City & Corporate Expansion

Partner with restaurant chains, event caterers, and grocery networks at scale

Government & CSR Integration

Plug into municipal food-safety programs and corporate CSR reporting
